Why study sea salt?

- It plays an important global role in tropospheric chemistry and the radiation balance.
- EPA is planning to add it to the Regional Haze Rule accounting scheme.
- It can be viewed as a “standard reference material” *in ambient air*, useful for system QA/QC.
Areas of filled circles are proportional to numbers of “marine days” 

\[
\left( \frac{[Cl^-]}{a_{Cl,salt}} \geq 1 \text{ ug/m}^3 \right)
\]

during 2004. Size of open circles corresponds to 10 days (out of 122 total sampling days).

Smoky hazard

Smoke from a fire in Yolo County contributed to a choking day for parts of the Bay Area on Tuesday. In San Rafael, particles of soot, dust and smoke small enough to enter air sacs in the lungs (10 microns, or less — about .0004 inches) increased dramatically as winds blew smoke over the area. At 10 a.m. there were 201 micrograms per cubic meter of the particles. Last year’s average maximum 24-hour measurement was 41.

Note: Data may be revised.
